
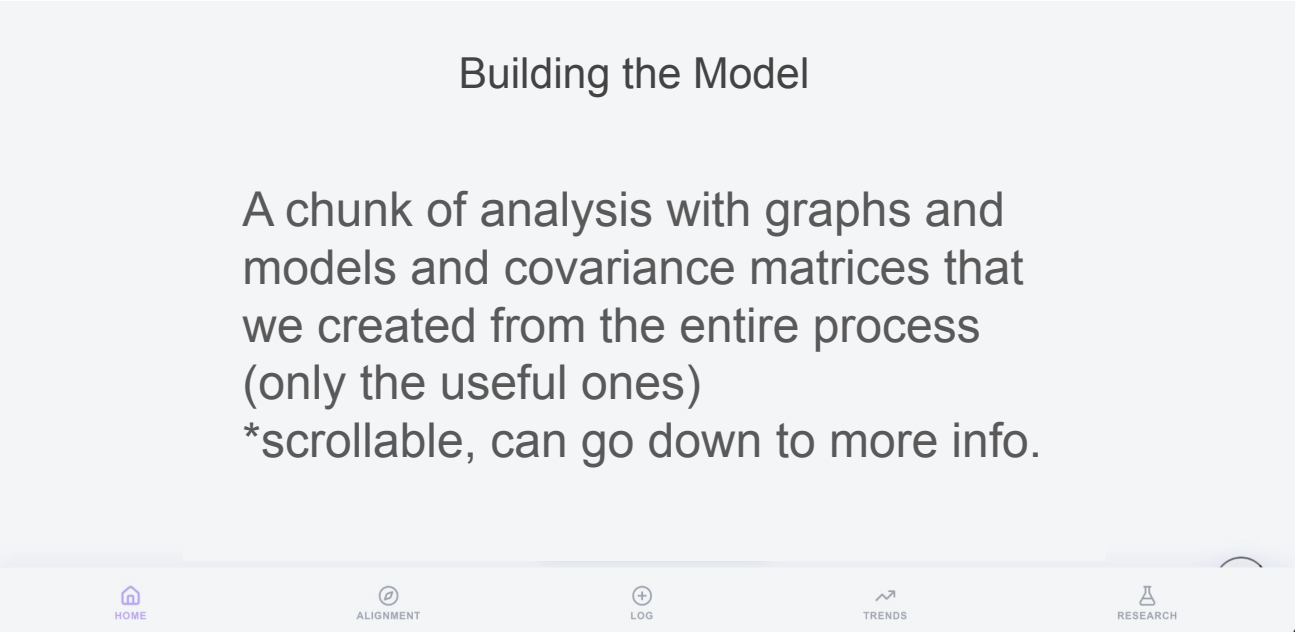
This serves an informative process in which I also want to be able to promote some menstruation knowledge in this section for education purpose, You can cross this tab out to enter the website

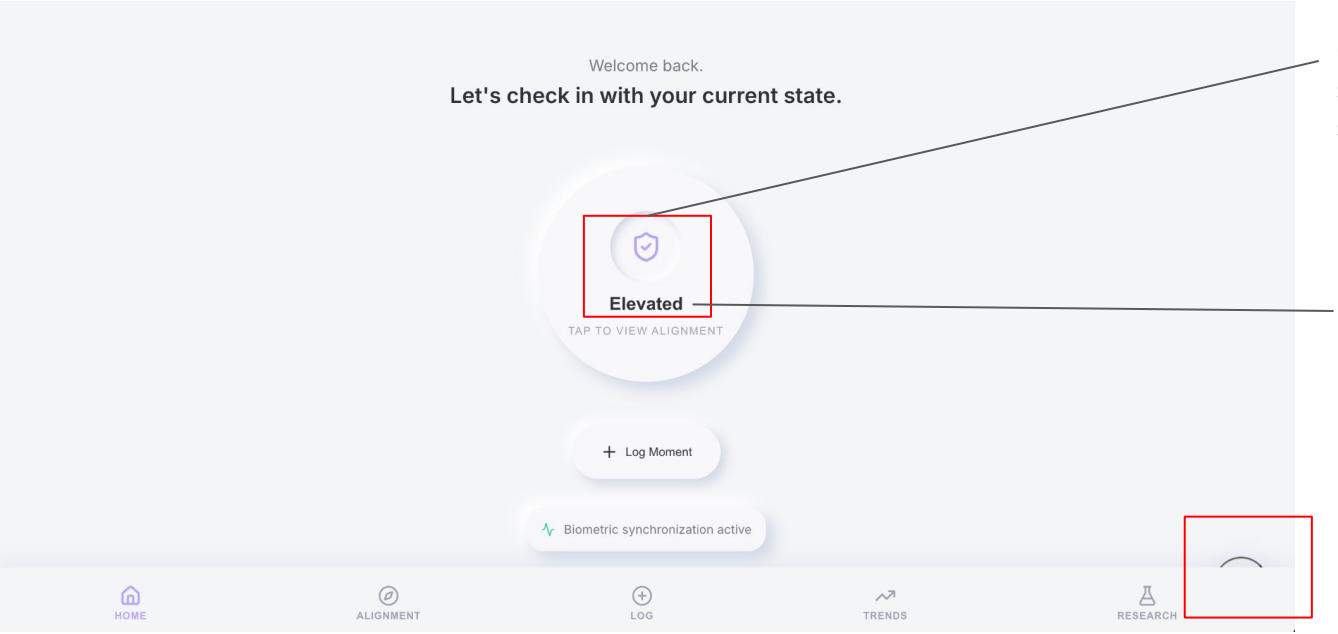
The chat is overlapped with the menu bar, either it pops up when mouse brushes over, or it stays as a stable icon on the side without being covered.

This is very important because it supports the cause of our research and algorithms

This read more jumps to a full research background, algorithm info, and models validation page like a paper/presentation and discuss all the detailed tests, cluster, models and trials that we tested and the conclusion that we reach with numerical results to make the decision of using what as model and using what as contributing features and why we switched from this to that



This is what the read more page should consist of, but I might change somethings into presentation that I can do before the demo



Change the icon to something more subtle or an emoji instead of this suggestive icon

Don't say "Elevated", this is the button to enter data upload, maybe somethings that's like "check my cycle" or "menstruation and stress test"

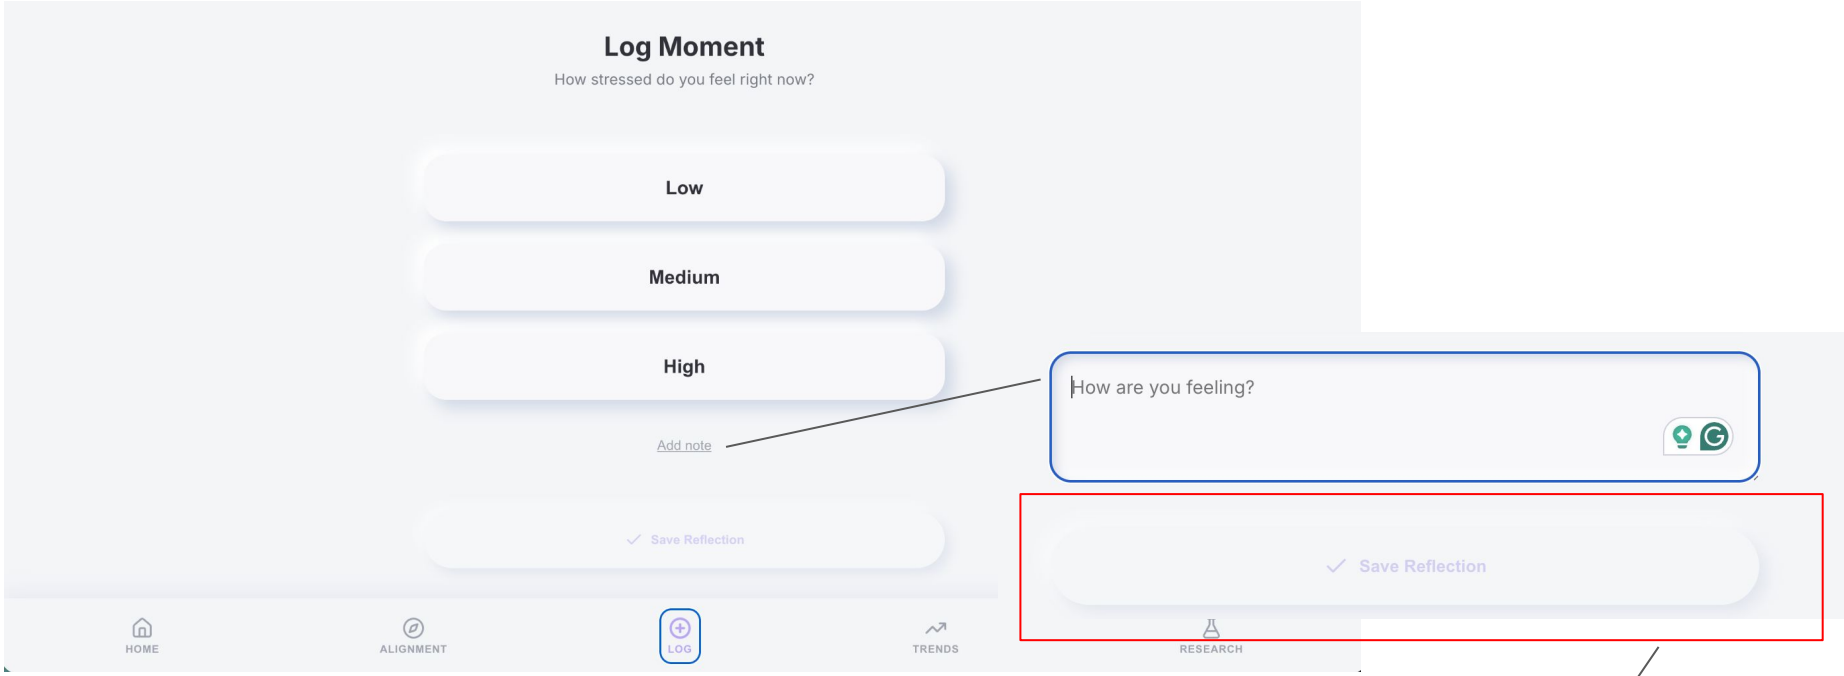
This is the starter home page that should lead to data/csv/xlsx input, in between this and the alignment users should actually be prompted to use the personalized input

This is actually very confusing because what is this score comparing to and is it percentage? I need more information on here and visualizations as well including extensions and pages to how this user is marked in the population

Again, what is this status comparing to? How many different assessments are there

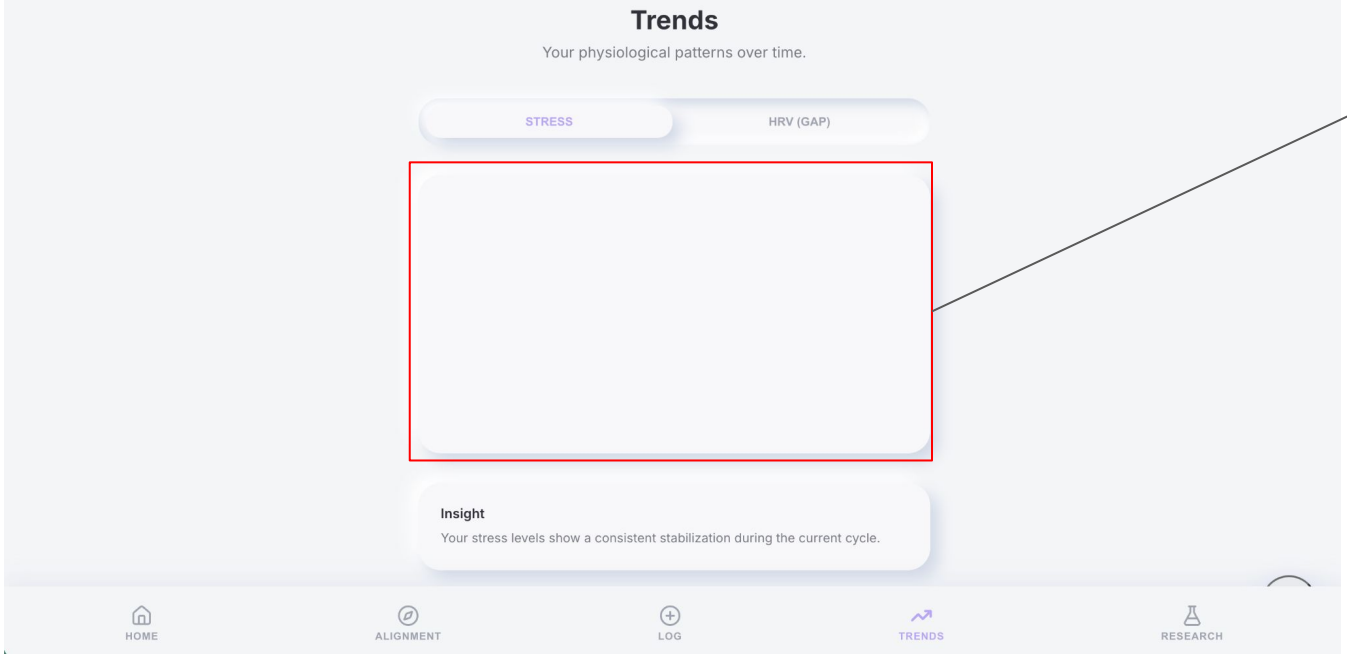
This explanation section is very good and necessary

This result should purely be based on the user's input data running through those models I've chosen and build and run this individual in these models to get the actual test result instead of hard-code everything



This feature should be related to the watch data collection feature, which should come after a consent to record and add on to the data for better study

There should be a slight change in structure when user actually enters something so it allows them to sabe the reflection and gestures that the notes are savable

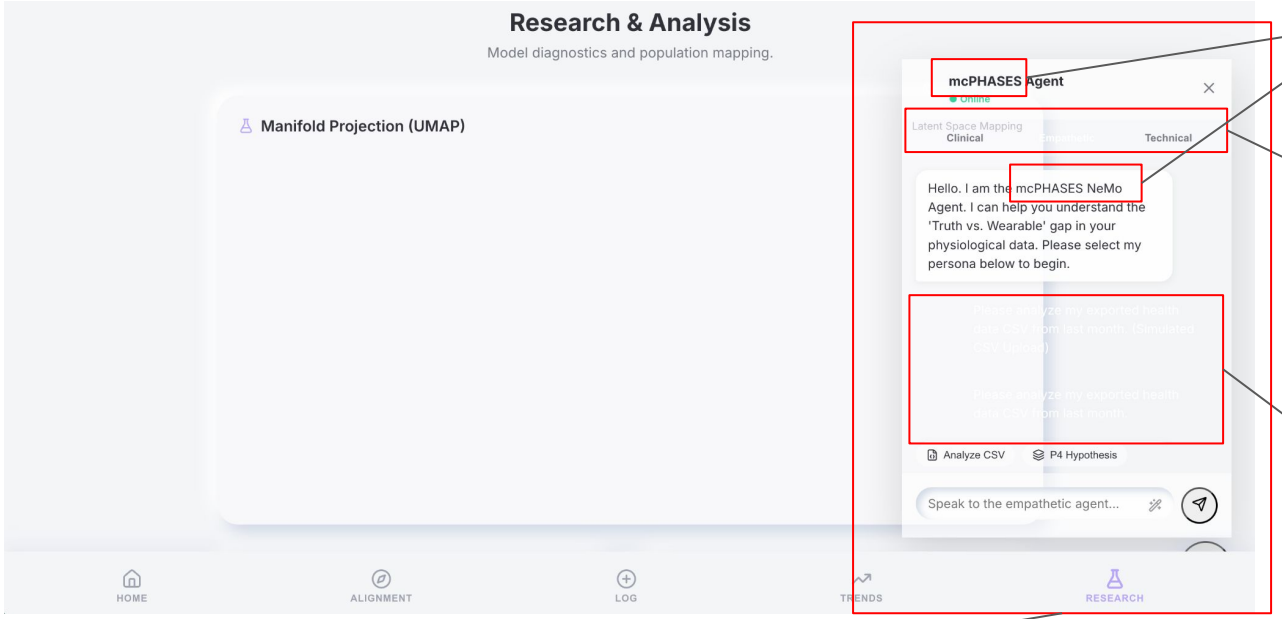


Why is the graph missing? It should be a visualization with interactive elements for both Stress and HRV spikes/fluctuation

This should be an overall assessment or view of user’s continuous or time series behaviors

Not showing the visualization

Need to be a little interactive



Don’t use mcPhase as the title for things

Take out the clinical personality because it is not allowed to give clinical information or advices, just empathetic and technical

These texts are white and almost can not be seen, the style needs to be stable across all chats

The agentic AI window is slightly transparent, don’t allow that change the text block style or make things messy
